# Git, Android Studio, and Beyond

How an open source tool integrates with an open source platform

# A Brief History of Open Source

- Linux
- Git
- The Cathedral and The Bazaar
- The spread of open source
- Android sits on Linux

## The Cathedral and the Bazaar

- Differentiated Open Source from Free Software
- Inspired Netscape to create Mozilla project, which eventually lead to Firefox
- https://en.wikipedia.org/wiki/The\_Cathedral\_and\_the\_Bazaar
- http://www.catb.org/~esr/writings/cathedral-bazaar/cathedral-bazaar/
- Enough eyeballs tame complexity

# My original intention for this presentation

- Android Studio app development
- Too big of a topic
- Started learning about Git, which I had never heard of
- Fit in with my interest about Open Source
- Much narrower topic, and still ties into Android Studio

## Where did Linux come from

- Unix
- Linus Torvalds
- Open Source development
- Took off
- A multitude of versions
- On a multitude of platforms

## The need for Git

- Former VCS Bitkeeper, proprietary system
- Need for a new VCS with better performance and right functionality
- Developed in 2005
- Many possible origins of the name Git
- About a month to really get up and running and performing the way intended

## 1.7 · Adding All Changes

Great! You also can use wildcards if you want to add many files of the same type. Notice that I've added a bunch of .txt files into your directory below.

I put some in a directory named "octofamily" and some others ended up in the root of our "octobox" directory. Luckily, we can add all the new files using a wildcard with **git add**. Don't forget the quotes!

→ git add '\*.txt'

```
# Changes to be committed:
# (use "git rm --cached <file>..." to unstage)
#
#

Success!

$ git commit -m "Add cute octocat story"

[master (root-commit) 20b5ccd] Add cute octocat story
1 file changed, 1 insertion(+)
create mode 100644 octocat.txt
```

#### Advice

#### Wildcards

We need quotes so that Git will receive the wildcard before our shell can interfere with it. Without quotes our shell will only execute the wildcard search within the current directory. Git will receive the list of files the shell found instead of the wildcard and it will not be able to add the files inside of the octofamily directory.

- 20 minute talk where Linus Torvalds talks about his work, open source, Linux, git, and what makes him good at what he does

## Some Linux numbers and facts

- 50 Core developers
- Roughly 1,000 contributors to each release
- Linux design tried initially to mimic Unix
- Git much more of a design from scratch
- Linux has a single kernel that runs on a multitude of processors -- from mobile devices to supercomputers

# Mirror of Git project on Github

- A mirror of Git project, can't update it
- Cool from a historical perspective
- Very first commit (git doing a repository of it's own development) https://github.com/git/git/commits/master?after=20fed7cad40ed0b96232feb82

# Linux irony

- Linus Torvalds was trying to optimize Linux as a desktop operating system
- Even with the huge number and variety of distributions, it's never quite taken off in the desktop market
- However, other than the gaming platform market and desktops, linux dominates on most other computer platforms

## Market share by category [edit]
